

## ENVIRONMENT AGENCY GO GREEN

The Environment Agency have recently installed a system of EcoCooling in their Data Centre in Reading, this will save over 60 tonnes of carbon emissions from their two CRAC units that usually cool the area.

We removed one large pane of glass and replaced this with a colour co-ordinated panel, fully weatherproofed and then passed the duct through this panel, the ducting was also colour co-ordinated.

The whole installation will pay for itself in less than 18 months and help in lowering their Carbon footprint.

The EcoCooling system provides 30KW of cooling and links to the two existing CRAC units that now act as N+2 resilience, Celsius undertook the whole installation including electrics, water, builders work and all structural steelwork.
